Cosmology and Multi-Messenger Astrophysics with Gamma-Ray Bursts

Lorenzo Amati
(INAF – OAS Bologna)
Gamma-Ray Bursts: the most extreme phenomenon in the Universe
Standard scenarios for GRB progenitors

**LONG**
- energy budget up to $>10^{54}$ erg
- long duration GRBs
- metal rich (Fe, Ni, Co) circum-burst environment
- GRBs occur in star forming regions
- GRBs are associated with SNe
- likely collimated emission

**SHORT**
- energy budget up to $10^{51} - 10^{52}$ erg
- short duration (< 5 s)
- clean circum-burst environment
- old stellar population

[Diagram of hyperaccreting black holes with labels for NS-NS merger, BH-NS merger, BH-VD merger, very, very fast jet, 0.01M⊙ torus, 1M⊙ torus, few M⊙ torus, NS/BH - He core merger, after common envelope, collapsar = rotating, collapsing "failed" supernova]
Long GRBs
- direct detection and accurate location of exploding stars (and their host galaxies) up to the Cosmic Dawn!!!
- cosmological «beacons»
- standardizable cosmological candles??

THESEUS
Transient High Energy Sky and Early Universe Surveyor

Lead Proposer (ESA/M5): Lorenzo Amati (INAF – OAS Bologna, Italy)

Coordinators (ESA/M5): Lorenzo Amati, Paul O’Brien (Univ. Leicester, UK), Diego Gotz (CEA-Paris, France), C. Tenzer (Univ. Tuebingen, D), E. Bozzo (Univ. Genève, CH)

Payload consortium: Italy, UK, France, Germany, Switzerland, Spain, Poland, Denmark, Czech Republic, Ireland, Hungary, Slovenia, ESA

Interested international partners: USA, China, Brazil
May 2018: THESEUS selected by ESA for Phase 0/A study !!!!! (2018-2021, launch 2032)

**ESA SELECTS THREE NEW MISSION CONCEPTS FOR STUDY**

7 May 2018  A high-energy survey of the early Universe, an infrared observatory to study the formation of stars, planets and galaxies, and a Venus orbiter are to be considered for ESA’s fifth medium class mission in its Cosmic Vision science programme, with a planned launch date in 2032.

The three candidates, the Transient High Energy Sky and Early Universe Surveyor (Theseus), the SSpace Infrared telescope for Cosmology and Astrophysics (Spica), and the EnVision mission to Venus were

Synergy with next generation large facilities (E-ELT, SKA, CTA, ATHENA, GW and neutrino detectors)
Shedding light on the early Universe with GRBs

Because of their huge luminosities, mostly emitted in the X and gamma-rays, their redshift distribution extending at least to $z \sim 9$ and their association with explosive death of massive stars and star forming regions, GRBs are unique and powerful tools for investigating the early Universe: SFR evolution, physics of re-ionization, galaxies metallicity evolution and luminosity function, first generation (pop III) stars.
A statistical sample of high–z GRBs can provide fundamental information:

- measure independently the cosmic star–formation rate, even beyond the limits of current and future galaxy surveys
- directly (or indirectly) detect the first population of stars (pop III)
Even JWST and ELTs surveys will be not able to probe the faint end of the galaxy Luminosity Function at high redshifts (z>6-8)

- the number density and properties of **low-mass galaxies**
Abundances, HI, dust, dynamics etc. even for very faint hosts. E.g. GRB 050730: faint host (R>28.5), but $z=3.97$, [Fe/H]=-2 and low dust, from afterglow spectrum (Chen et al. 2005; Starling et al. 2005).

- the neutral hydrogen fraction
- the escape fraction of UV photons from high-z galaxies
- the early metallicity of the ISM and IGM and its evolution
Abundances, HI, dust, dynamics etc. even for very faint hosts. E.g. GRB 050730: faint host (R>28.5), but $z = 3.97$, $[\text{Fe/H}] = -2$ and low dust, from afterglow spectrum (Chen et al. 2005; Starling et al. 2005).

Exploring the multi-messenger transient sky

- Locate and identify the electromagnetic counterparts to sources of gravitational radiation and neutrinos, which may be routinely detected in the late ‘20s / early ‘30s by next generation facilities like aLIGO/aVirgo, eLISA, ET, or Km3NET;

- Provide real-time triggers and accurate (~1 arcmin within a few seconds; ~1” within a few minutes) high-energy transients for follow-up with next-generation optical-NIR (E-ELT, JWST if still operating), radio (SKA), X-rays (ATHENA), TeV (CTA) telescopes; synergy with LSST

- Provide a fundamental step forward in the comprehension of the physics of various classes of transients and fill the present gap in the discovery space of new classes of transients events
LIGO, Virgo, and partners make first detection of gravitational waves and light from colliding neutron stars

Lightcurve from *Fermi/GBM* (50 – 300 keV)

LIGO, Virgo, and partners make first detection of gravitational waves and light from colliding neutron stars

**THESEUS:**

- Short GRB detection over large FOV with arcmin localization
- Kilonova detection, arcsec localization and characterization
- Possible detection of weaker isotropic X-ray emission
THESEUS mission concept

- **Soft X-ray Imager (SXI):** a set of four sensitive lobster-eye telescopes observing in 0.3 - 5 keV band, total FOV of ~1sr with source location accuracy 0.5-1’;

- **X-Gamma rays Imaging Spectrometer (XGIS):** 3 coded-mask X-gamma ray cameras using bars of Silicon diodes coupled with CsI crystal scintillators observing in 2 keV – 10 MeV band, a FOV of ~2-4 sr, overlapping the SXI, with ~5’ source location accuracy;

- **InfraRed Telescope (IRT):** a 0.7m class IR telescope observing in the 0.7 – 1.8 μm band, providing a 10’x10’ FOV, with both imaging and moderate resolution spectroscopy capabilities (→ redshift)

**THESEUS mission concept**

- LEO (< 5°, ~600 km)
- Rapid slewing bus
- Prompt downlink
THESEUS will have the ideal combination of instrumentation and mission profile for detecting all types of GRBs (long, short/hard, weak/soft, high-redshift), localization them from a few arcmin down to arsec and measure the redshift for a large fraction of them.
THESEUS will also detect and localize down to 0.5-1 arcmin the soft X-ray short/long GRB afterglows, of NS-NS (BH) mergers and of many classes of galactic and extra-galactic transients.

For several of these sources, THESEUS/IRT will provide detection and study of associated NIR emission, location within 1 arcsec and redshift.
Shedding light on the early Universe with GRBs

The figure shows the age of the Universe as a function of redshift. The data is divided into three categories: Theseus (High res. spec.), Theseus (photometric), and Swift. The table below provides the number of GRB detections per year for different redshift ranges:

<table>
<thead>
<tr>
<th>THESEUS GRB#/yr</th>
<th>All</th>
<th>z &gt; 5</th>
<th>z &gt; 8</th>
<th>z &gt; 10</th>

THESEUS SYNERGIES
GW/multi-messenger and time-domain astrophysics

GW transient sources that will be monitored by THESEUS include:

- **NS-NS / NS-BH mergers:**
  - **collimated** EM emission from short GRBs and their afterglows (rate of \( \leq 1/yr \) for 2G GW detectors but up to 20/yr for 3G GW detectors as Einstein Telescope)
  - Optical/NIR and soft X-ray **isotropic** emissions from macronovae, **off-axis afterglows** and, for NS-NS, from newly born ms magnetar spindown (rate of GW detectable NS-NS or NS-BH systems, i.e. dozens-hundreds/yr)

- **Core collapse of massive stars:** Long GRBs, LLGRBs, ccSNe (much more uncertain predictions in GW energy output, possible rate of \( \sim 1/yr \))

- **Flares from isolated NSs:** Soft Gamma Repeaters (although GW energy content is \( \sim 0.01\%-1\% \) of EM counterpart)
Promptly and accurately localizing e.m. counterparts to GW events with THESEUS

110° × 30°
Detection, study, arcsecond localization and redshift of afterglow and kilonova emission from shortGRB/GW events with THESEUS/IRT.

Precise localization is mandatory to activate large ground-based telescopes as VLT or ELT from which detailed spectral analysis will reveal the intrinsic nature of these newly discovered phenomena.

THESEUS measurements + sinergy with large e.m. facilities -> substantial improvement of redshift estimate for e.m. counterparts of GW sources -> cosmology

Estimating $H_0$ with GW170817A
Time-domain astronomy and GRB physics

- survey capabilities of transient phenomena similar to the Large Synoptic Survey Telescope (LSST) in the optical: a remarkable scientific synergy can be anticipated.

- substantially increased detection rate and characterization of sub-energetic GRBs and X-Ray Flashes;

- unprecedented insights in the physics and progenitors of GRBs and their connection with peculiar core-collapse SNe;
Localization of GW/neutrino gamma-ray or X-ray transient sources

**THESEUS Core Science** is based on two pillars:

- probe the **physical properties of the early Universe**, by discovering and exploiting the population of high redshift GRBs.
- provide an **unprecedented deep monitoring** of the soft X-ray transient Universe, providing a fundamental contribution to multi-messenger and time domain astrophysics in the early 2030s (synergy with aLIGO/aVirgo, eLISA, ET, Km3NET and EM facilities e.g., LSST, E-ELT, SKA, CTA, ATHENA).

**THESEUS Observatory Science** includes:

- study of thousands of faint to bright X-ray sources by exploiting the **unique simultaneous availability of broad band X-ray and NIR observations**
- provide a **flexible follow-up observatory** for fast transient events with multi-wavelength ToO capabilities and **guest-observer programmes**.
In summary

- THESEUS, submitted to ESA/M5 by a large European collaboration with strong interest by international partners (e.g., US) will fully exploit GRBs as powerful and unique tools to investigate the early Universe and will provide us with unprecedented clues to GRB physics and sub-classes.

- THESEUS will also play a fundamental role for GW/multi-messenger and time domain astrophysics at the end of next decade, also by providing a flexible follow-up observatory for fast transient events with multi-wavelength ToO capabilities and guest-observer programmes.

- THESEUS is a unique occasion for fully exploiting the European leadership in time-domain and multi-messenger astrophysics and in key-enabling technologies (lobster-eye telescopes, SDD+scint.)

- THESEUS observations will impact on several fields of astrophysics, cosmology and even fundamental physics and will enhance importantly the scientific return of next generation multi messenger (aLIGO/aVirgo, LISA, ET, or Km3NET;) and e.m. facilities (e.g., LSST, E-ELT, SKA, CTA, ATHENA)

• ** ESA L2/L3 review**: “The SSC strongly endorses the need to continue pursuing in the future the discovery of GRBs”

• THESEUS will be a really unique and superbly capable facility, one that will do amazing science on its own, but also will add huge value to the currently planned new photon and multi-messenger astrophysics infrastructures in the 2020s to > 2030s.
